**Problem X: Answer the following short coding questions. Do NOT write functions and do NOT hardcode! (X points)**

a. Your best friend chungus has an image stored in `filename`, with a JPG extension, that he wants you to edit for him. He asks you to first replace the right half of the image with the left half to give him a buddy to hang out with during quarantine. Then you are to rotate the image ninety degrees clockwise to make the image look artsy. Finally, he wants you to double the number of rows of the image to make him big again as he has lost a lot of weight working out. You are to write the final image to a new image file with '`_grande.jpg`' appended before the file extension.

Example:

`lilchungus.jpg:`

`lilchungus_grande.jpg:`
